

# Energy-Efficient Designs

**Designing energy efficiency into your new home or addition is the key to low utility bills and lasting comfort.** From basic ENERGY STAR® designs to net zero energy homes, we have you covered. Our energy-efficient design services:

- Eliminate energy wastefulness
- Enhance your home's comfort
- Reduce toxic indoor air pollutants
- Improve your home's safety
- Exceed new government environmental and energy consumption standards
- Decrease dependence on energy sources from outside the United States
- Maximize the resale value of your home

**Because your home is unique, we analyze your design using our 3-step process:**

### Step 1: Customer Needs Analysis

We gather your project's detailed data and clarify the desired outcome of the design. We also prioritize the design characteristics and agree on our project deliverables.

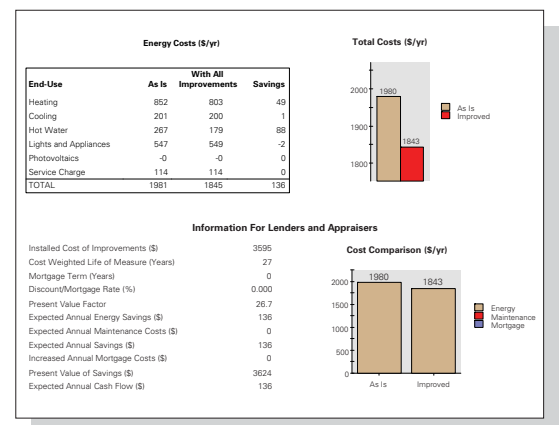

### Step 2: Detailed Data Analysis

We create a customized energy model for your specific project. We use as many as seven advanced software tools to predict if your home will meet your energy performance targets.

### Step 3: Customer Review and Design Finalization

With the preliminary design completed, we verify the project deliverables have been met and hand off the final documents. Additionally, you may elect to further support your project with one of our verification services such as ENERGY STAR, NAHB Green, and LEED certification.
